

# JUPITER

- 1. Giant Planet:** Jupiter is the largest planet in our solar system. It's so big that more than 1,300 Earths could fit inside it!
- 2. Great Red Spot:** Jupiter has a giant storm called the Great Red Spot. It's a swirling storm that has been raging for hundreds of years and is even larger than Earth!
- 3. Many Moons:** Jupiter has a whopping 79 known moons! The four largest moons, known as the Galilean moons (Io, Europa, Ganymede, and Callisto), were discovered by the astronomer Galileo Galilei in 1610.
- 4. Gas Giant:** Jupiter is made mostly of gases like hydrogen and helium. It doesn't have a solid surface like Earth. If you could stand on Jupiter, you would sink deep into its thick atmosphere.
- 5. Fastest Rotation:** Jupiter spins faster than any other planet in our solar system. A day on Jupiter lasts only about 10 hours, so it has the shortest day of all the planets.
