

SATURN

- 1. Ringed Planet:** Saturn is famous for its spectacular rings made of icy particles and rock. These rings are made up of many smaller ringlets and can be seen even with a small telescope from Earth.
- 2. Second Largest Planet:** After Jupiter, Saturn is the second-largest planet in our solar system. It's so big that more than 750 Earths could fit inside it!
- 3. Many Moons:** Saturn has at least 82 moons, and more moons are still being discovered! The largest moon, Titan, is even bigger than the planet Mercury.
- 4. Gas Giant:** Like Jupiter, Saturn is a gas giant, which means it's mostly made of gases like hydrogen and helium. It doesn't have a solid surface like Earth. If you could stand on Saturn, you would sink deep into its thick atmosphere.
- 5. Hexagonal Storm:** Saturn has a mysterious hexagonal-shaped storm at its north pole. This giant hexagon is made up of powerful winds swirling around a central point, and scientists are still studying why it has this unique shape.
